    int res = 0;
    for(int x = u; x > 0; x -= x & -x)
        for(int y = upper_bound(nodes[x].begin(), nodes[x].end(), v) - nodes[x].begin()
            (); y > 0; y -= y & -y)
            res += f[x][y];
    return res;
}

```

## 2.2 kdTree

```
// -----
// A straightforward, but probably sub-optimal KD-tree implementation
// that's probably good enough for most things (current it's a
// 2D-tree)
//
// - constructs from n points in O(n lg^2 n) time
// - handles nearest-neighbor query in O(lg n) if points are well
//   distributed
// - worst case for nearest-neighbor may be linear in pathological
//   case
//
// Sonny Chan, Stanford University, April 2009
// -----

## 4.10 Stable Marriage

```

/*
 * Takes a set of m men and n women, where each person has
 * an integer preference for each of the persons of the opposite
 * sex. Produces a matching of each man to some woman. The matching
 * will have the following properties:
 * - Each man is assigned a different woman (n must be at least m).
 * - No two couples M1W1 and M2W2 will be unstable.
 * Two couples are unstable if
 * - M1 prefers W2 over W1 and
 * - W1 prefers M2 over M1.
 * INPUTS:
 * - m: number of men.
 * - n: number of women (must be at least as large as m).
 * - L[i][]: the list of women in order of decreasing preference of man i.
 * - R[j][i]: the attractiveness of i to j.
 * OUTPUTS:
 * - L2R[]: the mate of man i (always between 0 and n-1)
 * - R2L[]: the mate of woman j (or -1 if single)
 * ALGORITHM:
 * The algorithm is greedy and runs in time O(m^2).
 */

## 8 Misc

### 8.1 Lagrange polynomial

Given a set of  $k + 1$  data points  $(x_0, y_0), \dots, (x_j, y_j), \dots, (x_k, y_k)$  where no two  $x_j$  are the same, the interpolation polynomial in the Lagrange form is a linear combination

$$L(x) := \sum_{j=0}^k y_j \ell_j(x) \text{ of Lagrange basis polynomials}$$

$$\ell_j(x) := \prod_{\substack{0 \leq m \leq k \\ m \neq j}} \frac{x - x_m}{x_j - x_m} = \frac{(x - x_0)}{(x_j - x_0)} \cdots \frac{(x - x_{j-1})}{(x_j - x_{j-1})} \frac{(x - x_{j+1})}{(x_j - x_{j+1})} \cdots \frac{(x - x_k)}{(x_j - x_k)}$$

### 8.2 Planar graph

Theorem 1.  $e \leq 3v - 6$ .

Theorem 2. If there are no cycles of length 3, then  $e \leq 2v - 4$ .

Theorem 3.  $f \leq 2v - 4$ .

Euler's formula:  $v - e + f = 2$ .

### 8.3 Catalan number

$$C_n = \binom{2n}{n} - \binom{2n}{n+1} = \frac{1}{n+1} \binom{2n}{n}; C_{n+1} = \sum_{i=0}^n C_i C_{n-i} = \frac{2(2n+1)}{n+2} C_n$$

$C = 1, 1, 2, 5, 14, 42, 132, 429, 1430, 4862, 16796, 58786, 208012, 742900, 2674440$

### 8.4 Stirling number

\* **First kind:** number of permutations of  $n$  numbers with  $k$  cycles.

$$\left[ \begin{matrix} n+1 \\ k \end{matrix} \right] = n \left[ \begin{matrix} n \\ k \end{matrix} \right] + \left[ \begin{matrix} n \\ k-1 \end{matrix} \right]$$

for  $k > 0$ , with the initial conditions  $\left[ \begin{matrix} 0 \\ 0 \end{matrix} \right] = 1$  and  $\left[ \begin{matrix} n \\ 0 \end{matrix} \right] = \left[ \begin{matrix} 0 \\ n \end{matrix} \right] = 0$  for  $n > 0$ .

We have:  $(x)^{(n)} = x(x+1) \cdots (x+n-1) = \sum_{k=0}^n \left[ \begin{matrix} n \\ k \end{matrix} \right] x^k$

Signed Stirling number of the first kind:  $s(n, k) = (-1)^{n-k} \left[ \begin{matrix} n \\ k \end{matrix} \right]$ ,  $s(n+1, k) = -ns(n, k) + s(n, k-1)$ .

It's also given that:  $(x)_n = x(x-1)(x-2) \cdots (x-n+1) = \sum_{k=0}^n s(n, k)x^k$ .

-	k=0	k=1	k=2	k=3	k=4	k=5	k=6
n=0	1	-	-	-	-	-	-
n=1	0	1	-	-	-	-	-
n=2	0	1	1	-	-	-	-
n=3	0	2	3	1	-	-	-
n=4	0	6	11	6	1	-	-
n=5	0	24	50	35	10	1	-
n=6	0	120	274	225	85	15	1

\* **Second kind: number of ways to partition a set of n objects into k non-empty subsets and is denoted by  $S(n, k)$  or  $\left\{ \begin{matrix} n \\ k \end{matrix} \right\}$ .**

Explicit formula:  $\left\{ \begin{matrix} n \\ k \end{matrix} \right\} = \frac{1}{k!} \sum_{j=0}^k (-1)^{k-j} \binom{k}{j} j^n$

$$\left\{ \begin{matrix} n+1 \\ k \end{matrix} \right\} = k \left\{ \begin{matrix} n \\ k \end{matrix} \right\} + \left\{ \begin{matrix} n \\ k-1 \end{matrix} \right\}$$

Related recurrences

1.  $\sum_{k=0}^n \left\{ \begin{matrix} n \\ k \end{matrix} \right\} (x)_k = x^n$
2.  $\left\{ \begin{matrix} n+1 \\ k+1 \end{matrix} \right\} = \sum_{j=k}^n \binom{n}{j} \left\{ \begin{matrix} j \\ k \end{matrix} \right\}$
3.  $\left\{ \begin{matrix} n+1 \\ k+1 \end{matrix} \right\} = \sum_{j=k}^n (k+1)^{n-j} \left\{ \begin{matrix} j \\ k \end{matrix} \right\}$
4.  $\left\{ \begin{matrix} n+k+1 \\ k \end{matrix} \right\} = \sum_{j=0}^k j \left\{ \begin{matrix} n+j \\ j \end{matrix} \right\}$

-	k=0	k=1	k=2	k=3	k=4	k=5	k=6
n=0	1	-	-	-	-	-	-
n=1	0	1	-	-	-	-	-
n=2	0	1	1	-	-	-	-
n=3	0	1	3	1	-	-	-
n=4	0	1	7	6	1	-	-
n=5	0	1	15	25	10	1	-
n=6	0	1	31	90	65	15	1

Variants

1. **Associated Stirling numbers of the second kind:** An r-associated Stirling number of the second kind is the number of ways to partition a set of n objects into k subsets, with each subset containing at least r elements. It is denoted by  $S_r(n, k)$  and obeys the recurrence relation

$$S_r(n+1, k) = k S_r(n, k) + \binom{n}{r-1} S_r(n-r+1, k-1)$$

2. **Reduced Stirling numbers of the second kind:** Define the reduced Stirling numbers of the second kind, denoted  $S^d(n, k)$ , to be the number of ways to partition the integers 1, 2, ..., n into k nonempty subsets such that all elements in each subset have pairwise distance at least d. That is, for any integers i and j in a given subset, it is required that  $|i - j| \geq d$ . It has been shown that these numbers satisfy

$$S^d(n, k) = S(n-d+1, k-d+1), n \geq k \geq d$$

## 8.5 Bell number

**Definition:**  $B_n$  is the number of partitions of a set of size n. A partition of a set S is defined as a set of nonempty, pairwise disjoint subsets of S whose union is S.

$B = 1, 1, 2, 5, 15, 52, 203, 877, 4140, 21147, 115975, 678570, 4213597, 27644437, 190899322, 1382958545, 10480142147, 82864869804, 682076806159, 5832742205057, \dots$

**Formula:**

$$B_{n+1} = \sum_{k=0}^n \binom{n}{k} B_k, B_n = \sum_{k=0}^n \left\{ \begin{matrix} n \\ k \end{matrix} \right\}$$

$$B_{n+m} = \sum_{k=0}^n \sum_{j=0}^m \left\{ \begin{matrix} m \\ j \end{matrix} \right\} \binom{n}{k} j^{n-k} B_k. \text{ [Spidey (2008)]}$$

## 8.6 Eulerian number

**Definition:** the Eulerian number  $A(n, m)$  is the number of permutations of the numbers 1 to n in which exactly m elements are greater than the previous element (permutations with m "ascents")

*Basic properties*

$A(n, 0) = A(n, n-1) = 1$  for all values of n.

$$A(n, m) = (n-m)A(n-1, m-1) + (m+1)A(n-1, m)$$

Explicit formula:  $A(n, m) = \sum_{k=0}^m (-1)^k \binom{n+1}{k} (m+1-k)^n$ .

-	k=0	k=1	k=2	k=3	k=4	k=5	k=6
n=1	1	-	-	-	-	-	-
n=2	1	1	-	-	-	-	-
n=3	1	4	1	-	-	-	-
n=4	1	11	11	1	-	-	-
n=5	1	26	66	26	1	-	-
n=6	1	57	302	302	57	1	-
n=7	1	120	1191	2416	1191	120	1

**Eulerian number of the 2nd kind:** The permutations of the multiset  $\{1, 1, 2, 2, \dots, n, n\}$  which have the property that for each k, all the numbers appearing between the two occurrences of k in the permutation are greater than k are counted by the double factorial number  $(2n-1)!!$ . The Eulerian number of the second kind, denoted  $\langle\langle n \rangle\rangle$ , counts the number of all such permutations that have exactly m ascents.

The Eulerian numbers of the second kind satisfy the recurrence relation, that follows directly from the above definition:

$$\langle\langle n \rangle\rangle = (2n-m-1) \langle\langle n-1 \rangle\rangle + (m+1) \langle\langle n-1 \rangle\rangle,$$

with initial condition for n = 0, expressed in Iverson bracket notation:

$$\langle\langle 0 \rangle\rangle = [m=0].$$

## 8.7 Combinatorics

1.  $\binom{n}{k} = \binom{n}{n-k}$
2.  $\binom{n}{k+1} = \binom{n-1}{k+1} + \binom{n-1}{k}$
3.  $k\binom{n}{k} = n\binom{n-1}{k-1}$
4.  $k\binom{n}{k} = (n-k+1)\binom{n}{k-1}$
5.  $\binom{n}{0} + \binom{n+1}{1} + \binom{n+2}{2} + \dots + \binom{n+k}{k} = \binom{n+k+1}{k}$
6.  $\binom{n}{n} + \binom{n+1}{n} + \binom{n+2}{n} + \dots + \binom{n+k}{n} = \binom{n+k+1}{n+1}$
7.  $\binom{n}{0} - \binom{n}{1} + \binom{n}{2} - \dots + (-1)^n \binom{n}{n} = 0$
8.  $\binom{n}{1} + 2\binom{n}{2} + 3\binom{n}{3} + \dots + n\binom{n}{n} = n2^{n-1}$
9.  $\binom{n}{k}$  is divisible by  $n$  if  $n$  is prime and  $1 \leq k \leq n-1$
10. [Vandermonde]  $\binom{m+n}{k} = \sum_{i=0}^k \binom{m}{i} \binom{n}{k-i}$

## 8.8 Euler's totient function Lemma

For all  $n$  and  $m$ , and  $e \geq \log_2(m)$  it holds that:

$$n^e \% m = n^{\phi(m)+e\% \phi(m)} \% m.$$

## 8.9 Burnside's Lemma

Let  $G$  be a finite group that acts on a set  $X$ . For each  $g$  in  $G$  let  $X^g$  denote the set of elements in  $X$  that are fixed by  $g$  (also said to be left invariant by  $g$ ), i.e.  $X^g = \{x \in X | g.x = x\}$ . Burnside's lemma asserts the following formula for the number of orbits, denoted  $|X/G|$ :

$$|X/G| = \frac{1}{|G|} \sum_{g \in G} |X^g|.$$

## 8.10 Johnson's rule for scheduling jobs

2 machines:

- Job i: A[i], B[i]
- Sort by min(A[i], B[i])
- Consider job i (sorted order):
- if A[i] ≤ B[i] → schedule first
- else schedule last

## 8.11 Dilworth's theorem

- An antichain in a partially ordered set is a set of elements no two of which are comparable to each other.
- A chain is a set of elements every two of which are comparable.
- In any finite partially ordered set, the maximum number of elements in any antichain equals the minimum number of chains in any partition of the set into chains.

## 8.12 Properties of Hamiltonian Path

1. All Hamiltonian graphs are biconnected, but a biconnected graph need not be Hamiltonian.
2. The number of different Hamiltonian cycles in a complete undirected graph on  $n$  vertices is  $(n-1)!/2$  and in a complete directed graph on  $n$  vertices is  $(n-1)!$ . These counts assume that cycles that are the same apart from their starting point are not counted separately.

**BondyChvtal theorem:** BondyChvtal theorem operates on the closure  $cl(G)$  of a graph  $G$  with  $n$  vertices, obtained by repeatedly adding a new edge  $uv$  connecting a nonadjacent pair of vertices  $u$  and  $v$  with  $degree(v) + degree(u) \leq n$  until no more pairs with this property can be found.

A graph is Hamiltonian if and only if its closure is Hamiltonian.

**Dirac (1952):** A simple graph with  $n$  vertices ( $n \geq 3$ ) is Hamiltonian if every vertex has degree  $n/2$  or greater.

**Ore (1960):** A graph with  $n$  vertices ( $n \geq 3$ ) is Hamiltonian if, for every pair of non-adjacent vertices, the sum of their degrees is  $n$  or greater.

**Ghouila-Houiri (1960):** A strongly connected simple directed graph with  $n$  vertices is Hamiltonian if every vertex has a full degree greater than or equal to  $n$ .

**Meyniel (1973):** A strongly connected simple directed graph with  $n$  vertices is Hamiltonian if the sum of full degrees of every pair of distinct non-adjacent vertices is greater than or equal to  $2n-1$ .

## 8.13 Geometry Formulas

Given a triangle  $ABC$ , we have several formulas:

$$c^2 = a^2 + b^2 - 2ab \cos C$$

$$\text{Sphere: } V = \frac{4}{3}\pi r^3; A = 4\pi r^2$$

$$\begin{aligned} 1. \text{ Compute the length of median lines: } & V = \frac{\pi h}{6} (3a^2 + h^2); A = 2\pi r h = \\ m_a^2 = \frac{2(b^2+c^2)-a^2}{4}; m_b^2 = \frac{2(a^2+c^2)-b^2}{4}; m_c^2 = \frac{2(a^2+b^2)-c^2}{4} & = 2\pi r^2 (1 - \cos \theta) = \pi (a^2 + h^2); r = \\ & \frac{a^2 + h^2}{2h} \end{aligned}$$

2. Compute the length of bisectors:

$$l_a^2 = \frac{bc}{(b+c)^2} [(b+c)^2 - a^2];$$

$$l_b^2 = \frac{ac}{(a+c)^2} [(a+c)^2 - b^2];$$

$$l_c^2 = \frac{ab}{(a+b)^2} [(a+b)^2 - c^2];$$

3. Assume the area of  $ABC$  is  $S$ , it holds that:

$$S = \frac{1}{2}ah_a; S = \sqrt{p(p-a)(p-b)(p-c)}; S =$$

$$\frac{abc}{4R}; S = pr;$$

$$S = (p-a)R_a$$

4. Law of sines

$$\frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C} = 2R$$

5. Law of cosines:
